

**SURVEY OF WEED CONTROL AND PRODUCTION PRACTICES
ON SUGARBEET IN EASTERN NORTH DAKOTA AND MINNESOTA - 2006**

Aaron L. Carlson, John L. Luecke, and Alan G. Dexter

Sugarbeet Research Technician, Sugarbeet Research Specialist, and Extension Sugarbeet Specialist

North Dakota State University and the University of Minnesota
Fargo, ND

Other portions of the survey are published in the
Entomology and Plant Pathology sections.

The thirty-eighth annual weed control and production practices questionnaire was mailed in September, 2006 to sugarbeet growers producing sugarbeet for the American Crystal Sugar Company, the Minn-Dak Farmers Cooperative, and the Southern Minnesota Beet Sugar Cooperative. Growers were requested to evaluate weed control and sugarbeet injury from specific herbicides, and to list the most important weed and production problems. In addition, growers were requested to list insecticide use, fungicide use, total acreage, acres of hand-weeded sugarbeet, herbicide application methods and cost of hand thinning and hand weeding. Insecticide use and fungicide use portions of the survey can be found in the Entomology and Plant Pathology sections.

Sugarbeet growers planted 744,330 acres of sugarbeet in the Red River Valley and West Central Minnesota in 2006. Growers representing 24 percent of the total acres responded to the survey. The responses to the questionnaire are reported in Tables 1 to 28.

Table 1 gives a summary of herbicide use and performance averaged over all counties. The number of growers reporting the use of a herbicide treatment is listed and the acres treated is expressed as a percentage of the total acreage reported on the survey. Multiple herbicide treatments are tabulated for each grower, thus the number of growers reporting in Table 1 exceeds the total number of survey responses. Also, multiple herbicide treatments on the same acreage are listed separately in the tables, thus acres treated exceeds 100%. The ratings of weed control and sugarbeet injury are presented as the percentage of growers who judged weed control or sugarbeet injury as belonging in the listed categories. Data for individual counties are in Tables 2 through 16.

The trade names listed in the tables for the herbicides are the original trade names. These old trade names also represent the generic formulations of the same active ingredient. Thus Nortron represents Etho SC and Ethotron; Betamix represents D-P Mix and Phen-Des; Betanex represents Des and Alphanex; Progress represents Des-Phen-Etho; Stinger represents ClopyrAg; and Select represents Select Max, Prism, and Arrow.

Total sugarbeet acreage treated with herbicides in 2006 was 386%, which compares to 378% in 2005, 427% in 2004, 437% in 2003, 428% in 2002 and 368% in 2001. The acres treated does not include "other weed control methods" which were non-herbicidal methods. Ro-Neet, Dual, Far-Go, Eptam and Nortron were the soil applied herbicides reported in 2006. Soil applied herbicide use was 47% in 1989, 32% in 1993, 11% in 1998, 4% in 2002, 29% in 2003, 31% in 2004, 24% in 2005 and 23% in 2006. Postemergence herbicide use was 335% in 2006, 336% in 2005, 379% in 2004, 380% in 2003, 388% in 2002 and 342% in 2001. Postemergence herbicide use dropped from 388% in 2002 to 380% in 2003, 379% in 2004, 336% in 2005 and 335% in 2006. Sugarbeet injury from PRE or PPI Dual Magnum declined from 53% of the survey respondents indicating moderate or severe sugarbeet injury in 2003 to 22% indicating moderate or severe injury in 2004, 19% in 2005 and back up to 22% in 2006.

The usage of postemergence grass control herbicides was 215% of the acreage in 2006 as compared to 203% in 2005, 226% in 2004, 214% in 2003, 209% in 2002 and 214% in 2001. Assure II was used on 13% of the acreage in 2002, 15% in 2003, 9% in 2004, 12% in 2005 and 6% in 2006. Prism/Select was used on 190% of the acreage in 2002, 180% in 2003, 198% in 2004, 165% in 2005 and 199% in 2006.

Poast was used on 17% of the acreage in 2002, 19% in 2003, 20% in 2004, 25% in 2005 and 11% in 2006. Most of the grass herbicides were applied in combination with the micro-rate or mid-rate which included an oil adjuvant. About 16% of the acres reported were treated with a grass herbicide used alone. Betanex use was 107% of the acreage in 2001, 112% in 2002, 100% in 2003, 71% in 2004, 51% in 2005 and 62% in 2006. Betamix use was 116% of the acreage in 2001, 139% in 2002, 115% in 2003, 125% in 2004, 95% in 2005 and 93% in 2006. Progress use was 81% of the acreage in 2001, 97% in 2002, 122% in 2003, 137% in 2004, 149% in 2005 and 157% in 2006. Progress use is increasing due to the problem with kochia in sugarbeet. UpBeet use was 278% of the acreage in 2001, 332% in 2002, 324% in 2003, 306% in 2004, 276% in 2005 and 280% in 2006. Stinger use was 138% of the acreage in 1997, 291% in 1999, 298% in 2000, 274% in 2001, 304% in 2002, 305% in 2003, 310% in 2004, 275% in 2005 and 273% in 2006. The most common herbicide treatment in 2006 was Progress + UpBeet + Stinger + Select + Oil adjuvant on 63% of the acreage. Combination treatments that included an oil generally would be micro-rate or mid-rate treatments. Treatments including oil were applied to 258% of the acreage in 2006, 241% in 2005, 273% in 2004, 297% in 2003, 301% in 2002 and 265% in 2001.

The rotary hoe or harrow were used on 41% of the acres in 2006 compared to 56% in 2005, 64% in 2004, 65% in 2003, 42% in 2002, 63% in 2001 and 62% in 2000. The electrical discharge system, weed pullers, mowing or swathing were used on 7.6% of the acreage in 1995, 1.6% in 1997, 2.4% in 2001, 3.1% in 2002, 2% in 2003, 0.5% in 2004, 1.9% in 2005 and 1.7% in 2006.

Kochia was named most often as "worst weed" in sugarbeet in 2006 (Table 18). Kochia was named the worst weed problem by 41% of the survey respondents in 2006 compared to 29% in 2005, 41% in 2004, 46% in 2003, 26% in 2002, 32% in 2001, 43% in 2000, 33% in 1999 and 13% in 1998. The widespread occurrence of kochia that is resistant to UpBeet helps explain the prevalence of kochia being named as worst weed. Rainfall was unusually low in 2006 in several areas which may help explain the increase in the % of respondents who named kochia as worst weed in 2006. Kochia is a weed that thrives in dryer conditions. Pigweed species was the most common "worst weed" choice in 2005, 2002 and 2001. The percentage of respondents indicating pigweed species as their worst weed was 40% in 1999, 18% in 2000, 43% in 2001, 44% in 2002, 25% in 2003, 21% in 2004, 42% in 2005 and 35% in 2006. Common lambsquarters was named most important weed problem in sugarbeet by 18% of respondents in 2006, 15% in 2005, 25% in 2004 and 18% in 2003.

Weeds were named as the most serious production problem by 57% of the survey respondents in 2006 compared to 36% in 2005, 47% in 2004, 61% in 2003, 53% in 2002 and 52% in 2001. (Table 19). The percentage of respondents who named emergence and stand as their worst problem was 5% in 2001, 19% in 2002, 1% in 2003, 21% in 2004, 3% in 2005 and 9% in 2006. The percentage of respondents who named Cercospora leaf spot (CLS) as their worst problem was 36% in 1998, 6% in 1999, 3% in 2000, 1% in 2001, 1% in 2002, 1% in 2003, 0% in 2004, 0% in 2005, and less than 1% in 2006. The Section 18 labels for Eminent in 1999 through 2004, the full label for Eminent in 2005 and the new label for Headline in 2003 probably explain the reduction in Cercospora being identified as the worst problem.

Rhizoctonia/aphanomyces was named as worst problem by 18% of the respondents in 2000, 16% in 2001, 9% in 2002, 11% in 2003, 8% in 2004, 22% in 2005 and 13% in 2006. Soil moisture and soil temperature have a very large influence on sugarbeet injury caused by rhizoctonia and aphanomyces.

Rhizomania was listed as a "worst problem" choice for the first time in 1997 (Table 19). Rhizomania caused identifiable yield loss only in the Southern Minnesota Beet Sugar Cooperative in 1998 but it was identified in the Red River Valley in 1999. Rhizomania was named as worst problem by 3% of the respondents in 1998, 2% in 1999 and 2000, by 3% in 2001 and 2002, 2% in 2003, 1% in 2004, 11% in 2005 and 3% in 2006.

The percentage of acreage hand weeded was 62% in 1996, 45% in 1997, 28% in 1998, 25% in 2000, 23% in 2001, 32% in 2002, 30% in 2003, 28% in 2004, 23% in 2005 and 28% in 2006 (Table 22).

Averaged over all herbicides, herbicides were band applied to 38%, broadcast applied with a ground sprayer to 59% and broadcast applied by air to 3% of the sugarbeet acreage in 2006 (Table 23). In 1998, 40% of the acreage was band treated, 37% was band treated in 2000 and 38% in 2002. Herbicides

were applied by air to 14% of the acreage in 2002, 9% in 2000 and 17% in 1998.

The cost of hand weeding and hand thinning varied from zero to \$60/A in 2006 (Table 24). The most common cost was zero dollars for 45% of the respondents. Zero cost responses were 56% in 2000, 57% in 2001, 48% in 2002, 41% in 2003, 47% in 2004 and 57% in 2005. The average cost of hand weeding as calculated from Table 24 was \$14.37/A in 2006 as compared to \$10.78/A in 2005, \$12.61/A in 2004, \$13.75/A in 2003, \$15.95/A in 2002, \$11.15/A in 2001 and \$34/A in 1995. The percentage of respondents who paid nothing for hand labor varied by county from 18% in Clay County to 76% in Norman and Mahnomen Counties.

Sugarbeet acreage operated by respondents to the survey in 2006 varied from less than 50 acres to over 2,000 acres (Table 25). The most common acreage was 400 to 599 acres for 20% of the respondents. Other common acreages were 100 to 199 acres at 10%, 200 to 299 acres at 12%, 300 to 399 acres at 17% and 600 to 799 acres at 16%. Fourteen percent of the respondents reported over 1,000 acres and 21% had over 800 acres. In 1998, 5% reported over 1,000 acres and 11% had over 800 acres.

Soybean followed sugarbeet in 2006 on 44% of the 2005 sugarbeet acreage (Table 26). Wheat was next on 30%, corn on 13% and dry bean on 9% of the 2005 sugarbeet acreage. County responses varied with soybean and corn responses more common follow crops in Cass and Clay counties and south while wheat and dry bean responses were more common north of Cass and Clay counties.

Wheat preceded sugarbeet more than any other crop, on 66% of the acres. Corn preceded sugarbeet on 14%, soybean on 6%, and dry bean on 5% of the 2006 sugarbeet acreage. Corn was the most common crop preceding sugarbeet in Chippewa and Renville counties while wheat was the most common in all other counties.

Row crop cultivation for weed control was used by 99.7% of the respondents to the question. One or two cultivations were used by 91% of the respondents. The average number of cultivations per field was 1.7 times in 2006 while the average was 1.9 in 2005, 2.0 in 2000, 2.4 in 1998, 3.2 in 1992 and 3.4 in 1987. Row crop cultivation has been reduced by half since 1987.

TABLE 1. SUMMARY OF ALL HERBICIDES USED IN SUGARBEET REPORTED IN 2006.
