SURVEY OF INSECTICIDE USE IN SUGARBEET IN EASTERN NORTH DAKOTA AND MINNESOTA - 2003

John L. Luecke and Alan G. Dexter Sugarbeet Research Specialist and Extension Sugarbeet Specialist

North Dakota State University - University of Minnesota Fargo, ND

Other portions of the survey are published in the Weed Control and Plant Pathology sections

Sugarbeet growers reported sugarbeet acreage treated with insecticide on the annual survey of sugarbeet growers (Table 1). Counter 15G, Counter 20G, Lorsban 15G and Mustang were primarily used as planting-time treatments, whereas Lorsban 4E and Asana were primarily applied postemergence. Counter 15G and Lorsban 15G were used on 45% and 10% of the acres, respectively, in 2003 while Counter 15G was used on 48% and Lorsban 15G on 10% of the acreage in 2002. Lorsban 4E usage was 2% in 2000, 11% in 2001, 2% in 2002 and 2% in 2003. Averaged over all insecticides and counties, 75% of the acreage was treated in 2003 compared to 70% in 2002, 83% in 2001, 71% in 2000, 74% in 1999 and 83% in 1998.

The grower evaluations of insect control averaged over counties is presented in Table 2. The satisfaction with root maggot control generally was good with 97% evaluating control as good or excellent. Other insect control was evaluated as good or excellent by 93% of the respondents.

Cutworm, wireworm, white grub, grasshopper, armyworm, springtail and lygus were identified as insect problems treated with insecticide in 2003 (Table 3). Cutworm and wireworm were the most common.
